

Malta Starthistle Fact Sheet

Centaurea Melitensis

Asteraceae Family

Southeastern Arizona Wildflowers and Plants

Joseph M. DiTomaso, University of California - Davis, Bugwood.org

D. Walters and C. Southwick, Table Grape Weed Disseminule ID, USDA APHIS ITP. Bugwood.org

Distinguishing Features:

- ❶ **Flowers:** The flowers are yellow, span up to 1.5 inches, and are surrounded by a ring of sharp tan spines.
- ❷ **Seeds:** Seeds are tan with gray stripes. They are covered with fine hairs and have hooks to encourage spread by contact with other animals. Seeds can survive for up to 3 years in the soil.
- ❸ **Leaves:** The leaves are alternate and narrowly oblong with smooth, toothed margins. They can be covered with stiff, thick hairs and resinous dots.
- ❹ **Flowering Time:** Malta Starthistle flowers from May through September.
- ❺ **Life cycle:** Malta Starthistle sprouts in late fall, remains a basal rosette through the winter, and in the spring grows 1-2 foot stems lined with spiny thorns. It flowers through the summer, producing seed in the fall.

Impacts:

- Malta Starthistle produces vigorous early growth and large mats that quickly displace other native species.
- Due to its spiny thorns, Malta Starthistle can reduce an area's potential for recreation.
- Malta Starthistle has been implicated in the emergence of chewing disease, a neurological disease in horses.

Control:

- Small infestations of Malta Starthistle can be effectively controlled by manually pulling and disposing in the trash prior to seed production.
- Biological control is largely ineffective. It is a poor grazing plant due to its thorns and toxicity. Animals avoid it if possible.
- When applied just before flower production, chemical control can be effective in controlling Malta Starthistle populations.
