

SALT LAKE COUNTY GIS

Announcing 2014 as a Year of GIS

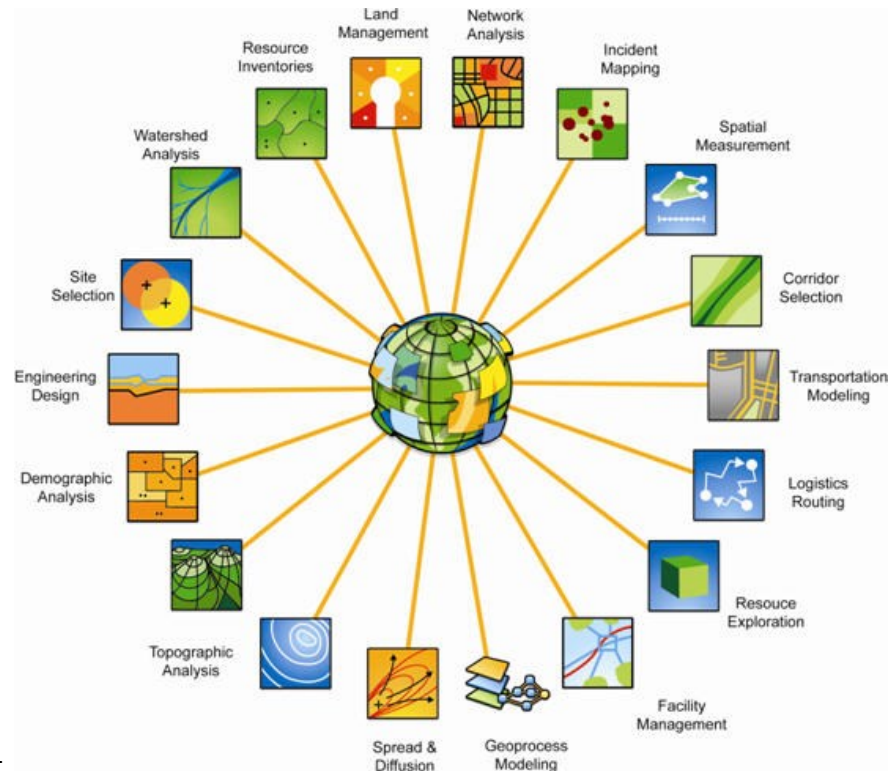

What is GIS?

Nearly all of the services that Salt Lake County provides to its citizens occur at a specific location. Service delivery may be dependent on the location the service is provided to.

In order to serve the citizens of Salt Lake County we as employees may be asked such questions as how many clients do you serve in a city, township or County Council district? Or you may receive a call from someone wanting a business license and you need to be able to quickly tell if the location is an area that falls into the county's jurisdiction. How do you answer these and other questions easily?

The way to answer these and many other questions is to make use of the Salt Lake County Geographic Information System (GIS). GIS is a set of tools that:

- Provide a location component to your data
- Allows for comparison of different information and spatial relationships
- Makes it easy to create maps that can be published to the web or as hard copies

STAY TUNED FOR MORE INFORMATION...

Throughout the coming year the members of the GIS community will be providing more information about GIS through econnect.
